

Bonus 4 - ŘEŠENÍ

① $y' = \frac{x^2(2x-3)}{(x-1)^2}$

$$\textcircled{2} \quad l = 2x + 2y \Rightarrow 2y = l - 2x \Rightarrow y = \frac{l}{2} - x$$

$$S = x \cdot y = x \left(\frac{l}{2} - x \right) = \frac{l}{2} \cdot x - x^2 \rightarrow \max$$

$$\frac{ds}{dx} = \frac{l}{2} - 2x = 0 \Rightarrow 2x = \frac{l}{2} \Rightarrow \underline{\underline{x = \frac{l}{4}}} \Rightarrow \underline{\underline{y = \frac{l}{4}}}$$

(2) $z = 2x + y$, maximize: $x + 2y \leq 8$
 $3x + y \leq 6$
 $y \geq 0$

VRSTEVNICE:

$$2x + y = 2$$

$$2x + y = 4$$

...

maximum v bode $[8,0]$, $z_{\max} = 16$

minimum v bode $[z_0]$, $z_{\min} = 4$
